

Products, quality and innovation

In a market that is getting more and more demanding, **Ecopack's** new challenges are strictly related to these three pillars: products, quality and innovation.

With a strong tradition of several decades in the production of baking moulds for the confectionery industry, the company based in Turin is yet looking at the future. The classical range consisting of moulds for panettone, colomba and tarts has been enriched by the introduction not only of new items, like lotus cups in different sizes and colours, but also of baking moulds for bread or street food, always following clients' specific requests. Therefore, it comes the company big focus on products and target on high quality standards, through the selection of certificated raw material that complies with international regulations, concerning direct food contact packaging and resistance to high temperatures for baking.

In this regard, Ecopack has obtained the BRC certification (global standard for packaging and packaging materials issue 5), which is an absolute guarantee in food industry.

Also machinery has an important role in maintaining high quality level. Engineering is a strategic point for Ecopack that, especially during the last years, has been strongly investing in technology, improvement of production process (entirely managed in-house) and launch of new plants (the last one was started in 2015 in Tunisia), giving to the company an increasing international profile. www.ecopack.com
